

What's new?

News and outlook · Version 0.9 (beta) · August 17, 2026

New in version 0.9

- **EventFoto now speaks English.** The whole app is available in German and English — and you can switch the language right in the app's settings, without changing your iPhone.
- **Inviting is now effortless.** The invitation link and QR code also work for guests who don't have EventFoto yet: they land on a small web page that walks them through the installation — with your invitation code included. Anyone who already has the app jumps straight into the event.
- **No photo twice.** The app now notices when a photo has already been uploaded and simply skips it — no duplicates in the gallery, no wasted storage.
- **The organizer joins the party.** Whoever creates an event can now join as a regular guest and contribute their own photos.
- **A new look.** Its own app icon, a launch screen and a clean design with the EventFoto logo.
- **If something acts up.** Under Settings → “Share diagnostics” you can send us a short technical report with one tap — no photos, no names. It helps us find issues faster.
- **Lots of small improvements:** previews of your own uploads appear instantly, the list of joined events can be tidied up, and error messages are easier to understand.

What we're working on next

- **Gallery in the browser** — so guests without the app can view and save the approved photos, too.
- **App Store launch** — after the beta, EventFoto will officially arrive on the App Store.
- **Your-data overview** — on request, a summary of the data stored about you (deliberately very little).
- **Packages & pricing** — fair plans for bigger events. During the beta everything stays free.
- **Android** — a version for Android devices is planned.

Good to know: EventFoto is currently in its testing phase. Look and features may still change before release. After an event ends, all photos are deleted automatically — that's our promise, and it stays.
